2 techniques to automatically discover a VN topology

Network Virtualization

- **Network Virtualization (NV)** refers to abstracting network resources traditionally delivered in hardware to software.
 - NFV (*Network Functions Virtualization*) : Decoupling the network functions from proprietary hardware so that it can run on software or standardized hardware.
 - SDN (*Software-Defined Networking*) : Separation, at the hardware level, of the network control plane from the forwarding plane.

* Taken from : https://www.commsbusiness.co.uk/

Introduction I

Investigations <u>Use Cases</u>

Conclusion

Software-Defined Networking

Open vSwitch (1)

- A software implementation of a network switch/router
- First release : May, 2010
- An SDN switch : centralized control via OpenFlow protocol
- Many OSs are supported : Linux, BSD, Windows,
- Deployed on many cloud/virtualization platforms : OpenStack, OpenNebula, ...
- Support for several network protocols : Ipv4/Ipv6, TCP, UDP, VLAN, MPLS, sFlow, Netflow, ..

Open vSwitch (2)

Open vSwitch (3)

- Flow-based policy : Same actions on packets belonging to the same flow.
- **Flow :** Set of packets that share some common criteria (Packet header fields + metadata).

ovs-dpctl add-flow datapath1 "in_port(0),eth(),eth_type(0x0806),arp()", 1

Flow lookup • Userspace Upcall Downcall Netlink Interface Kernel **Key extraction** Masked key Miss in port(p0), eth(src=01:23:45:67:89:f0, in_port(p0), 3 dst=ff:ff:ff:ff:ff;ff), eth(), **Flow Table** eth type(0x0806), eth type(0x0806), arp(sip=192.168.0.1, arp tip=192.168.0.2,op=1,...), Masks

Introduction

Use Cases

Conclusion

Investigations

Open vSwitch (3)

Userspace

• Generic Netlink protocol :

Open vSwitch (4)

• Handler threads :

• Process upcalls and reactively install flows in datapath flow table.

(1) Are installed flows still valid?

(3) How to keep statistics up-to-date ?

(2) When should we delete them ?

Open vSwitch (5)

- Revalidator threads :
 - Periodically fetch flows from the datapath
 - Run each flow through ofproto-dpif classifier and check if it is still valid
 - Delete idle/incorrect flows
 - Update statistics

Motivations

- OVS offers some debugging tools to help users design their flow rules.
 - **Example :** a tool to track a packet through the pipeline of OpenFlow tables without sending actual packets.

ovs-appctl ofproto/trace

• OVS offers several commands to allow users get a snapshot of a given internal state ... but this latter could quickly change.

Ovs-dpctl dump-flows

• Many network monitoring protocol are supported (sFlow, Netflow, SPAN/RSPAN, ...).

Goal

Propose an efficient performance analysis tool to help (administrators) ...

- 1) Analyze the performance of Open vSwitch based on adapted performance metrics.
- 2) Troubleshoot its performance issues.
- 3) Understand the root causes of packet processing latencies

Work Environment

- Software :
 - Open vSwitch (version 2.11.9)

• Data Collection :

- LTTng (version 2.10)
- Kernel and userspace tracing / static instrumentation
- Performance Analyses :
 - Trace Compass framework

Framework Architecture

Introduction

Use Cases Conclusion

Performance metrics

• Microflow and megaflow cache hit rate :

```
Utilization_{EMC} = nbHit (EMC) * 100 / (nbHit (EMC) + nbHit (megaflow) + (nbMissUpcalls))
```

- Number of installed flows in the datapath.
- Packet rate per flow
- Evaluate the load of revalidator-threads :
 - Required time to re-validate datapath flows
 - Computed datapath flow-limit

Performance metrics

- Evaluate the load of handler-threads :
 - Upcall waiting queue size
 - Average upcall waiting/processing time
 - Upcall rate issuing per port/Type

Use Cases

Conclusion

A Kernel module to tag packets encapsulated in the upcall (skb-mark field) just before sending them.

Introduction

Use case (1)

Impact of an inappropriate configuration

POLYTECHNIQUE MONTREAL – Adel Belkhiri

Use Cases (1)

- Experiment setup :
 - OVS : 2 handler threads and 1 revalidator thread
 - Maximum number of cached flows (flow-limit) = 200k
 - Flow timeout = 10 seconds
 - CLI to install 200k flow rules
 - Trex traffic generator : 200K continuous streams with a rate of 1Mpps

Introduction Investigations Use Cases Conclusion

Use Cases (1)

Rate of upcall issuing

Number of active flows in datapath flow table

Introduction Investigations Use Cases Conclusion

Use Cases (1)

The Revalidator-thread was not able to perform re-validation in time.

Use Cases (1)

Adding a second revalidator-thread solved the problem.

Re-validation duration

Use case (2) What about OVS fairness ?

POLYTECHNIQUE MONTREAL – Adel Belkhiri

Use Cases (2)

- Experiment setup :
 - OVS : 2 handler threads + 2 revalidator threads
 - Maximum number of cached flows (flow-limit) = 1000
 - Using CLI to insert 5000 flow rules
 - Trex traffic generator : 5000 continuous streams with a rate of 500Kpps

Introduction Investigations Use Cases Conclusion

Use Cases (2)

Number of active flows in datapath flow table

Caching duration of flow rules

Use case (3) kernel/userspace flow key mismatch

POLYTECHNIQUE MONTREAL – Adel Belkhiri

Use Cases (3)

- Kernel and userspace modules can use different flow key representations.
- When the degree of support for a specific network protocol is different, a mismatch can happen.
 - **Example :** datapath only supports IPv4 while userspace supports both IPv4 and IPv6.
- 3 cases :

Kernel flow key
userspace flow key

Use Cases (3)

- Experiment setup :
 - OVS : 2 handler threads + 2 revalidator thread.
 - Maximum number of cached flows (flow-limit) = 200k.
 - 1 flow rule to pop an MPLS header and output it to a given port.
 - Trex traffic generator : 1 stream with a rate of 200Kpps Packets having double MPLS headers.

Packet rate at reception.

Packet rate at reception

Conclusion and Future Work

- Industry needs efficient tools to diagnose problems in software-defined networks and identify the root causes of traffic latencies.
- We are looking for new use cases and problems to solve in order to improve our analyses and tools
- Future work :
 - OVS/DPDK (Data Plane Development Kit) : better performance than standard OVS.
 - OVS entirely in userspace.
